

Grasshopper Script: The script utilizes three primary “sliders” to control the urban layout. As these parameters shift, the grid reorganizes, and building

Variable A:
Site metrics. (Road Width, Grid Spacing)

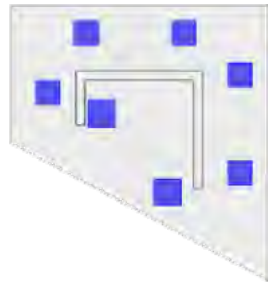

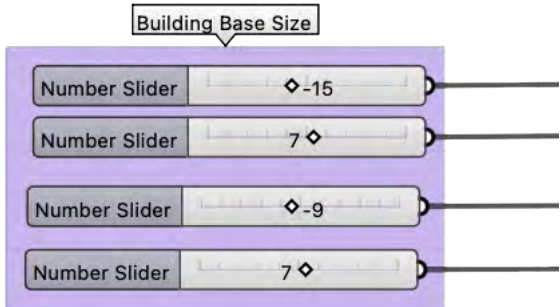

High Density Scenario:
Input: Max Height Upper Limit/ Min Lower Limit. Less restraints on zoning.
Result: CBD/City Center, high volume infrastructure

Variable B:
Zoning Envelope and Floor Area Ratio. (Inner vs. Outer Lot

Medium Density Scenario:
Input: Balanced Height Limits (not too high), moderate floor area ratio.
Result: Mid-rise urban layout, small business.

Variable C:
Density and Building Height Ranges

Low Density Scenario:
input: Low Height Limits, Low floor area ratio.
Result: Suburban layout, wider roads and increased open space.
